

The process behind a portfolio website

Last month, in April, my teacher assigned the entire class to create a portfolio website. We were asked to create a website containing information about ourselves, our skills, and our previous work. This assignment was given as a way to learn and understand how to create an attractive website. On this occasion, I will share my experience in the process of creating the portfolio website.

Before starting the website, we were assigned to create a design using Figma. In Figma, I designed several sections such as navbar, hero section, about me, my skill, project, and contact. I tried to create an attractive, creative, and unique design so that the final result looked good and structured.

After completing the design, I began coding the website using HTML, CSS, and JavaScript. This was the most challenging part because I encountered many issues, such as code errors, layouts that didn't match the design, animations that wouldn't work, and difficulties making the website responsive. When I encountered difficulties, I also used AI assistance to find solutions, understand the code errors, and get tips for a better and more attractive website.

Despite the challenges, I continued to work on fixing each error one by one by finding solutions, asking friends, using AI assistance, and learning from my mistakes. Ultimately, I felt proud of having successfully completed my portfolio website. From this assignment, I learned to be more patient, creative, and not give up easily when facing difficulties.
